

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A method for giving notice of an incoming call in a mobile communication terminal, comprising the steps of:

storing a plurality of vibration patterns, the plurality of vibration patterns including information associated with time periods for which vibration generation is maintained, time periods for which vibration generation stops, and intensity of vibration for each time period;

setting a vibration pattern, from among the stored vibration patterns, for a particular telephone number of previously stored telephone numbers in a particular incoming call notification mode; and

when an incoming call is received from a caller, generating vibration based on the set vibration pattern if a telephone number of the incoming call matches the particular telephone number.

2. (Cancelled)

3. (Currently Amended) A method for giving notice of an incoming call in a mobile communication terminal, comprising the steps of:

storing a plurality of vibration patterns, the plurality of vibration patterns including information associated with time periods for which vibration generation is maintained, time periods for which vibration generation stops, and intensity of vibration for each time period;

setting a vibration pattern, from among the stored vibration patterns, in an incoming call notification mode; and

when an incoming call is received, generating a vibration based on the set vibration pattern.

4. (Cancelled)

5. (Currently Amended) The method as set forth in claim 43, wherein the plurality of vibration patterns are configured by inputs of an intensity adjustment key and a time adjustment key

6. (Currently Amended) The method as set forth in claim 35, wherein the intensity adjustment key ~~and a time adjustment key are~~ is a volume adjustment keys ~~p~~ of the mobile communication terminal and the time adjustment key ~~are~~ is one of a left and right direction key of the mobile communication terminal.

7. (Currently Amended) The method as set forth in claim 45, wherein configuring and storing the plurality of vibration patterns comprises the steps of:

displaying a graph corresponding to information associated with time periods for which vibration generation is maintained, time periods for which vibration generation stops, and intensity of vibration for each time period, in response to the inputs of the intensity adjustment key and the time adjustment key from the user; and

storing a vibration pattern based on the displayed graph in response to a configuration completion command from the user.

8. (Currently Amended) The method as set forth in claim 43, wherein the plurality of vibration patterns are displayed in form of a graph according to a user's request.

9. (Currently Amended) The method as set forth in claim 43, wherein the plurality of vibration patterns are displayed in text form according to a user's request.
